EC00: Founders of Computing

1. Who you are highlighting

Tim Berners-Lee

2. When they lived

(June 8, 1955 ~)

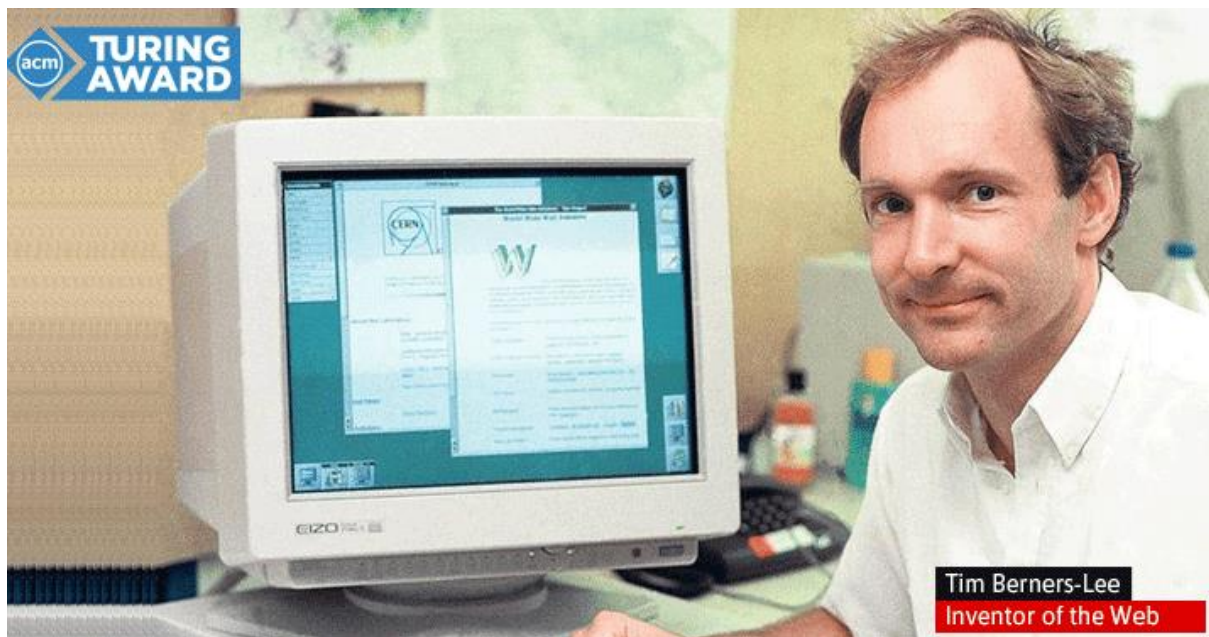

3. What they contributed to computing

The person who created the World Wide Web (www). Tim Berners-Lee has taken several steps to create WWW. When he worked at CERN(European Organization for Nuclear Research) in 1980, he developed software for the convenience(the organization and management of information and hardware/software that each employee wants) of working. This is the ENQUIRE that forms the basis of w3. Since then, researchers who are far away from each other have proposed a hypertext information delivery method with the aim of effectively sharing various information about the study. Hypertext made it possible to cross various documents and get a variety of information through hyperlinks Since then, he created the first web server named CERN HTTPd, and at the same time, he developed Nexus, a browser that can create and read web pages. He shared W3's patents free of charge with many people to open and connect information.

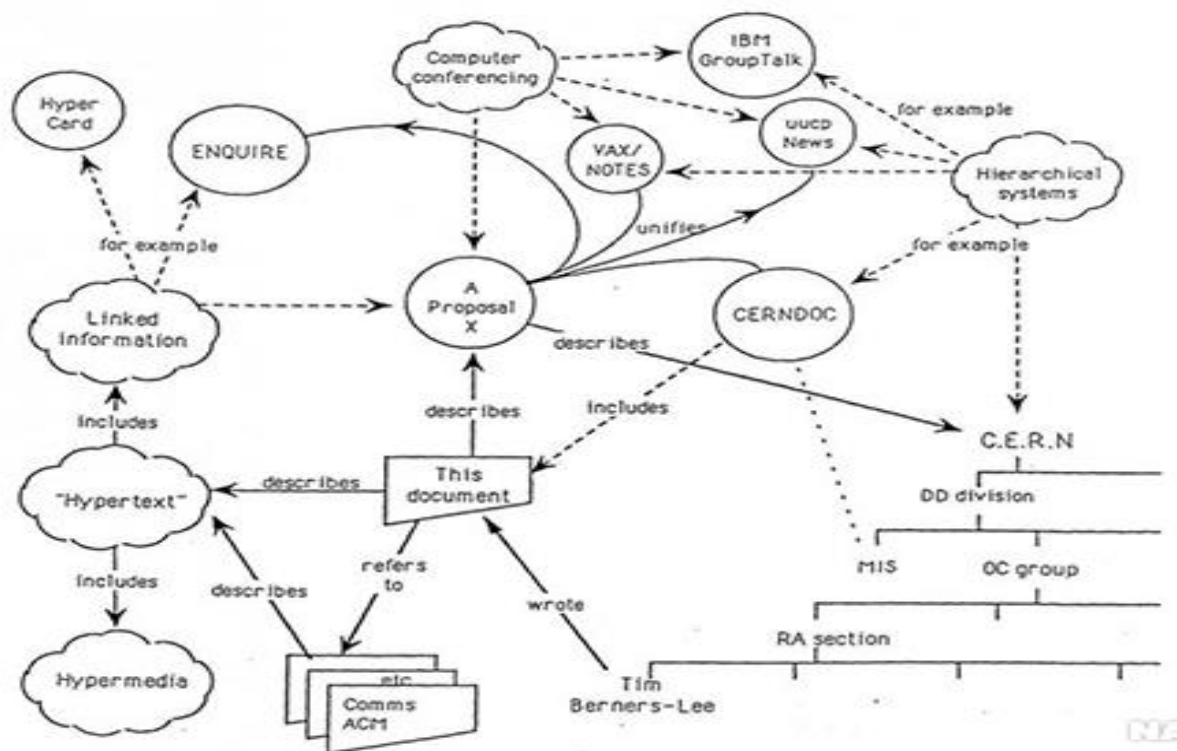

4. Why that contribution is important

Most of what we do over the Internet is connected to www. Through it, we created an era where everyone in the world can create, store, and share information. Simply, to communicate, watch videos, buy products, to watch the news, all these things are connected to www. Websites like Google, which we commonly use, are available through these webs. Now, the World Wide Web is located as an integral part of people.

5. Some pictures, preferably that include the person and their contribution
